

PROJECT 2-32

The growing interest in motorless flight has developed the need for a modern, high-performance two-place sailplane. More and more pilots want to share the fun and satisfaction of soaring with their family and friends.

The 2-32 is a thoroughbred high-performance sailplane based on our "total performance" concept and designed for two-place performance soaring, for advanced soaring instruction and pleasure flying. (It is not a replacement for the 2-22 which has

established itself as the backbone of most successful training programs.)

Our engineering department has been working on the proposed 2-32 for almost a year. It is a compromise between the many popular features of the 1-26 and our highly successful 2-25 special purpose sailplane that finished well up in the Internationals in 1954 and 1956 and is based upon our 30 years experience in developing government approved sailplanes.

For those seriously interested in such a sailplane, we will be pleased to send a 2-32 report and questionnaire. Results we get will have a great bearing on how early the ship will be available.
